

will be activated to have the characters, body structure and body language of a after some time. Otherwise, create temporary attraction fields and digital circumferences around a and x separately with some radius. Now, by connecting the two atmospheres using technologies like magnet, we can conclude the following conjecture:

Conjecture 3.

A people, having technologies specialty, can have the same body structure, body languages and characters of any person and can modify the body structure, body languages and characters of any person.

Assume that the body position of a is recorded when a is doing a work w , say the record w_1 . By Conjecture 3, every part of x can be activated to have the same brain and body structure of a . In this situation, apply the record w_1 to x . Then there may be a possibility that after some time x can realize how to do the work w . Also, this may be possible whenever the above records are applied to x . So, we have the conjecture:

CONJECTURE 4.

If 'a' is doing a work, then X can hack the strength to realize and do the work from 'a', without the knowledge of 'a'. If 'a' is a poet or writer or researcher or painter or singer etc., then X can hack the potential for the talents from a without the knowledge of a.

Example: Assume that 'a' is researching Mathematics. In this position, the brain of 'a' is recorded. Then, whenever the record is applied to another person x , x may realize and develop the same research idea. Suppose that 'a' is singing a song naturally, and that time the whole body of a is recorded. Then, whenever the record applies to x , x may have such a talent.

Assume that x has a health problem q and a be a suitable person having excellent and perfect health such that the body of x and a medically coincides. Then, the body of x can be recorded when x is being in the health problem q at high level, say the electronic record r . Let the electronic record of the relax position of the body of a be p . If r is continuously applied to a generating a digital circumference around a with some radius, then the body of a will have a change such as the body health condition of x . If the process is doing continuously, then the body conditions of a and x may be same, after some days. Next, if applying the record r to a is stopped, then the body of a will automatically start to cure the affected area of the body by the natural way, since a had already a good and fit healthy body and also a will take some basic medicines. Assume that the process is continuously recorded, say the record r_1 , till that r is completely cured in the body of a . Finally, if the records p and r_1 are continuously applied to x , then the health problem of x may be completely cured or the health problem of x may be temporarily cured whenever r_1 is applied to x . In the above process, a may be affected by dangerous disease or uncalculated pain.

Conjecture 5.

If a has a healthy body and x has been affected by a disease q, then q can be generated in the body of a using technologies and the body behavior formula of a can be observed and electronically recorded how the body of a cures the disease and also it can be used to cure the disease in the body of x. Similarly, the body behavior formula can be observed electronically how the body of a produces white and red blood cells. Also, it can be used to anybody. By generating a digital circumference around a persona, any lacer surgery to a can be done without the knowledge of a.

We define: A part of the body of a is said to be in technologically spoiled stage, if the part is modified as a died part using technology such that the died area can be rectified to the old level condition of the body. If each part of the body of a is in spoiled stage, then we call that a is in technologically spoiled stage.

Assume that a who is in the spoiled stage is connected with x , then the energy strength of x and a may be shared. So, there is a possibility that 'a' can be moved in the direction of x with the support of technology. In this case, suppose x wants to do some work w , but a do not like w , then a can be non-naturally moved by x to complete w . Suppose that the brain of x is in the spoiled stage and the whole body, other than the brain, of a is in the spoiled stage. In this situation, if both a and x are connected using technologies, then x may use the mind of a and also a may feel whatever the body of x is feeling.

Consider the eyes of a . suppose that the eyes of a see an object in the

practical life. At that time, the brain of a is recorded. Similarly, whatever the eyes see, the records can be collected, by Conjecture 2. Using this study, based on the movement of the brain of a , it may be possible to find out what the eyes of a are seeing. The same method will work out for every part of the body of a , like ears, mouth, etc. Using this, even a is in a closed room; it may be possible to know what a is seeing, hearing, doing etc.

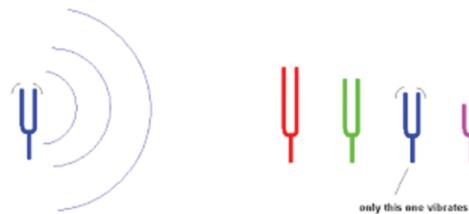

So, we conclude the following conjecture:

Conjecture6.

A person X, having a technology specialty, can control any other people. Also, a person can be constructed as a Robot, if the person doesn't know the above such process. So, a robot people can be stimulated to feel any pain available in the world, without touching the people manually and knowing anybody, for example, the person can be stimulated to have eager to eat a foot or to speak anything or to image anything or to create interest to read a book or to see an object or to avoid anything or to forget anything or to be mentally week or to have brain death or to be some time mentally offend person. The brain of a person can be used to solve any problem without the knowledge of the person. Moreover, X can observe whatever a person is seeing, hearing, doing etc. in a closed room or any other place.

Let χ be an election machine to elect. If χ is working in the vibration area of the technologies, then it is very clear to know the working mechanism of χ using technologies and also the working mechanism can be computerized. Then, we have:

- 1) There may be a possibility to change the programming set up of χ without touching χ manually, by generation magnetic and digital circumference around χ .
- 2) Since χ can be viewed as a big shape, for each vote, when the particular points of χ are pressed using some straight magnetic waves, it may be possible to vote for a particular person.
- 3) By Conjectures 1, 2, 3, 4, 5, and 6, the brain of any person can be washed to vote for a particular person, using technology.

So, we conclude the following conjecture.

Conjecture7.

The electronic machine system is not suitable for election. Also, the election atmosphere should be in the area having no technology vibration. By the similar way, if an ordinary person a has a computer which contains some software and personal documents, then there is a possibility that another person X can hack the software and documents from the computer.

Assume that a person a has been fixed to prepare questions for a public examination of a country and X can find a regarding the examination question paper. Then X can record the brain of a , when a is preparing questions and the answer key, by generating a digital circumference around a , say the record r . Assume that x writes the examination. When the record of the brain of a is applied to x , then the brain of x can be modified as the brain of a . Then, in the examination hall, when the record r is applied to x , then x can receive the matters to answer the examination questions and whatever a wrote in the recorded time. In this way, x can write the examination successfully.

There is another possibility: When a is taking the examination questions and its key, by Conjecture 6, X can observe what the eyes of a are seeing.

By generating a digital circumference around the computer where the result of the examination has been updated, it may be possible to reset the result in the computer, without knowing anybody.

Conjecture 8.

A person, who is preparing public exam questions and its key, should not be in the area covered by technology. Similarly, the atmosphere of

any examination and paper valuation manually should not be in the technology vibration. Also, any electronic machine is not suitable to use for examination paper valuation and to store the final marks.

Let a be a common person having scientific talents with good logic skills such that the dealing technique of the person to solve a practical life problem will be by logic. Such a person may be illegally used in many ways, without knowing anybody and the awareness of the person, by a person X having technology specialties to use independently.

Conjecture 9.

Suppose that a is walking or traveling on the road. Then, the attention of a can be stimulated to see some activities, which are not related to a , on the way by unnatural behavior of a sequence of people. Also, ' a ' may get many chances to see the same activities and sequence of people again and again whenever a is walking or traveling on away. After some time, ' a ' may think it as unnatural. Since it is a silent method, there will not be evidence. So, if a wants some proof, they should continuously note the process. After this stage, the same members appear with covering their heads by the helmet. In this situation, ' a ' may guess the faces of the persons wearing a helmet. Such talent in the brain of a can be electronically recorded. This administration can be used to research planets. For example, we can see one side of the Moon. Based on the side, it may be possible to realize the other side of the Moon. Moreover, assume that the brain of a person a and the brain of another person or non-people (Cow or Dog or etc.) or robot z can be connected using technology such that a can realize whatever z is feeling (seeing, hearing, etc.). Then, it is enough to send z to Moon or any other planet or anywhere from the earth by satellite or anything, to realize each and every thing what z is feeling in the place. Note that if the person a has any trouble, then z will never send signal.
